

INTRODUCTION AND POTENTIAL USE CASES

Practical systems for Unity's operating workflows

Shiftora is an integrated strategy and systems firm operating from Dubai and Mumbai. We design, build and operate custom software and AI systems within clients' existing applications.

We connect operational records, identify what needs attention and build the workflow that turns the finding into a completed action. For Unity, the starting point is one defined process with a measurable outcome.

OUR CONTRIBUTION

Connect the records

Bring documents, system events and business context together around one operational question.

Prepare the decision

Identify the exception, supporting evidence and next action under the process owner's rules.

Complete the workflow

Build the integration, review and follow-through that make the output usable in daily work.

Selected experience

MODEL DEVELOPMENT AND EVALUATION

Predictive scoring for a US legal marketplace

Developed a three-stage scoring system covering 1,067,445 prospect accounts in the documented March 2026 evaluation. It turns a large prospect book into scores and priority tiers for sales follow-up.

PLATFORM ENGINEERING

Consumer visa platform for a UAE travel business

Visa-platform work spans document intake, application workflows, pricing, payments and status tracking. The engagement connects customer-facing steps with the records and rules required to complete an application.

POTENTIAL USE CASES

Workflows to explore together

Each area is a proposal to assess against current priorities, existing systems and vendor coverage. The relevant business team would define the operating rules and acceptance criteria.

01 / CENTRAL PROCESS AUTOMATION

Resolve exceptions in existing automations

Automated work stops when an input is incomplete, inconsistent or outside the expected pattern.

Output: Classify the issue, collect the missing evidence and prepare a recovery action for approval and resumption through the existing workflow.

Measure: Handling time, correctly resolved cases and repeat failures.

02 / CUSTOMER SERVICE AND PRODUCT OPERATIONS

Carry complaints through to resolution

Resolving a complaint can require evidence and action from several bank teams or an external partner.

Output: Assemble the case history, identify missing evidence, prepare the response and track the authorised correction or refund to completion.

Measure: Time to actual resolution, repeat contacts and reopened cases.

03 / CREDIT OPERATIONS

Prepare loans for authorised disbursal

A sanctioned loan still needs complete evidence that its operational conditions have been met.

Output: Build a condition-by-condition evidence checklist, flag missing or inconsistent records and route outstanding items to the responsible owner.

Measure: Checklist accuracy, processing effort and readiness turnaround.

04 / PRODUCT, TECHNOLOGY AND TESTING

Verify product changes before release

An approved fee, reward or repayment change must produce consistent results across the affected customer journey.

Output: Translate approved rules into reviewable test scenarios, compare expected and actual results, and produce a traceable defect report.

Measure: Scenario coverage, test preparation effort and confirmed defects.

POTENTIAL USE CASES

Complete the work between systems

05 / FINANCE AND PROCUREMENT

Complete invoice exception work

An invoice can remain blocked while a branch, supplier and approver resolve missing acceptance or disputed charges.

Output: Bring together the invoice, contract and acceptance evidence; identify the blocker and prepare the follow-up needed to return the case to the payment process.

Measure: Manual handling effort, exception age and avoidable rework.

06 / DEPOSIT OPERATIONS AND PARTNERSHIPS

Complete funded deposit applications

An application can involve separate payment, verification and deposit-activation states across the bank and a partner.

Output: Trace the application across those states, identify pending work and route the authorised completion or refund with a clear customer update.

Measure: Pending-case age, completion accuracy and customer follow-ups.

07 / LOAN SERVICING AND CREDIT OPERATIONS

Finish loan closure and release tasks

Repayment is followed by several closure tasks, each with its own evidence, owner and completion status.

Output: Track approved adjustments, closure documents, bureau updates and security-release tasks; prepare follow-ups and escalate outstanding items.

Measure: End-to-end closure time, overdue tasks and repeat requests.

Working with Unity's current platforms

For Unity, the proposed work would sit alongside Oracle Fusion, Oracle analytics and existing RPA workflows, using approved interfaces or sample exports. Current applications remain the source of record, with business decisions and approvals retained by the bank.

PROPOSED NEXT STEP

A focused two-week proof of concept

Choose one workflow with the central process automation team. Over two working weeks, produce a working demonstration and a measured assessment of its value to the process owner.

The two-week period starts once scope, the process owner and approved sample access are agreed.

DAYS 1-3

Define the case and baseline

Select one workflow and agree its boundaries. Review approved sample cases, current system coverage and the measures that will determine whether the output is useful.

DAYS 4-7

Build the working demonstration

Connect the approved sample inputs, implement the agreed logic and produce the actual reviewable output: an evidence pack, prepared action or test report.

DAYS 8-10

Evaluate with the process owner

Compare the output with the current process on routine and difficult cases. Record accuracy, handling effort, remaining exceptions and the changes needed for implementation.

What Unity receives

- A working demonstration on an agreed, bounded set of cases.
- A comparison of output quality and handling effort against the current process.
- A clear recommendation on scope, dependencies and the next implementation step.

Evaluation would use approved sample data and access arrangements. Production deployment would follow the bank's applicable reviews and a separately agreed implementation scope.

Let's select one workflow to demonstrate.
